

Where should printers be located?

- Some want a printer on their own desk
 - Very convenient but expensive
- Some want to be able to print to any printer, no matter where it is
 - Flexible, able to borrow specialty printers as needed
- Finance people want to centralize everything
 - A single high-speed printer, single high-quality printer, and one color printer per building (most cost-effective)
- Others want to charge every expense
 - Regardless of how much is out there, those who use it, pay for it

Spring 2016

Real world

- People need to be able to print to any printer they have permission to use
- Centralized printing services can save money
 - Ten people who might otherwise buy slow, low-quality personal printers for \$50-150, without support contracts, can buy a single high-quality, fast shared printer with long-term maintenance
 - Plus the sysadmin only has to support one printer driver/printer rather than 10

Print services

- People **depend** on print services
 - for contracts
 - for proofreading
 - for quizzes
 - for reading long material that is less pleasant to read on-screen
- Print is a utility
 - It should **always** work

Spring 2016

CSE 265: System and Network Administration

Print system architecture

- Peer-to-peer
 - All hosts spool jobs directly to the destination printer
 - Simplest, but all clients must know current printer IP/name
 - Cannot route around broken printers
 - Limited by printer spool memory
- Central funnel
 - Hosts send print jobs to a central server which distributes
 - Can convert formats
 - Can provide access control
 - Can collect per-page billing
 - Can intelligently select printers
 - Single place for printer drivers

Spring 2016

CSE 265: System and Network Administration

©2004-2016 Brian D. Davison

Print architecture

- How centralized will printing be?
 - How many people will share a printer for general printing?
 - Who qualifies for a personal printer?
 - How will they be networked?
 - Network printers can benefit from a central print-spool
 - How will they be maintained?
 - How will they be paid for?

Print architecture (cont.)

- Who orders supplies and resupplies the printers?
 - Are the printers re-supplied when they are out (and users complain), or does someone visit them regularly?
- What kinds of printing technologies will be supported?
 - Postscript/PCL/PDF
 - Duplex printing
 - Laser vs. InkJet
 - LPD over IP vs. SMB, USB or parallel, etc.
- How will the printers be named?
 - You don't want people printing to the wrong building or wrong country (!) by mistake

LPD, LPRng, CUPS

Print Server Packages

- LPD is the old standard
 - Not found on current distributions
- LPRng
 - Designed for backwards compatibility with Berkeley and System V printing systems
 - Was common ages ago (default for Red Hat 7.3), but is now replaced by...
- CUPS – Common UNIX Printing System
 - Standard on modern distributions (our focus)
 - Now owned and maintained by Apple

Printing terms

- spooler
 - Daemon that receives print jobs, stores, prioritizes, and sends them sequentially to be printed
- PDL
 - Page Description Language, usually device and resolution independent
 - PostScript, PCL, PDF
- bitmap
 - JPEG, TIFF, GIF, PNG
- RIP
 - Raster image processor
 - Accepts PDL input, generates bitmap appropriate for a particular device
- filters
 - Modify print jobs on their way to a printer
- PostScript
 - Most common PDL – also a full programming language

client utility: lpr

- Invoked to submit a print job
 - typically use *-Pprinter* to choose which printer, default printer used when none is selected
 - % lpr -Phowler-lw -#2 thesis.ps
- Apps use it (even things like *enscript* and *Acrobat*)
- Checks */etc/printcap* for info about printer
- Under LPD it creates two files in */var/spool/lpd/printername*
 - One is a control file with handling info (like username)
 - Second is data file
- Then tells the print daemon about file

Types of printers

- Classified by connection interface
 - Serial and parallel printers
 - USB faster and the default today for personal printers
 - Network printers
 - Contain network interfaces (e.g., ethernet or wifi)
 - Accept jobs via one or more printing protocols
 - including via LPD, CIFS, IPP, HP JetDirect
- Classified by type of data
 - PostScript is well-supported under Linux/UNIX
 - Non-postscript printers require special software to convert to unique PDL (vendor supplied, or ghostscript)

filters

- Filters are typically shell scripts that run on spooled data before sending to the printer
- Can
 - Fix various non-printing sequences
 - Write out accounting records
 - Convert to a printer-supported PDL
 - Add banner pages

Spring 2016

CSE 265: System and Network Administration

©2004-2016 Brian D. Davison

lpq and lprm

- `lpq -Pprinter`
 - Examines the queue of jobs waiting to be printed on the particular printer
 - Shows the job id as well as owner, filename, size
- `lprm jobid`
 - Deletes one or more jobs, erasing the stored data files
 - Can delete with job id, or by username
 - Typically must be on machine where job was generated and must be same user (or root)
- Both work across a network (most of the time)

Spring 2016

CSE 265: System and Network Administration

CUPS

- Common UNIX Printing System
 - Latest rewrite of the printing system
- Also supports secure printing (SSL, etc.)
- Implements IPP: Internet Printing Protocol (HTTP-based)
- Supports load-balancing across a class of printers
- Supports automatic network configuration
- Standard in most Linux distributions

Spring 2016

lpc/lpadmin: make admin changes

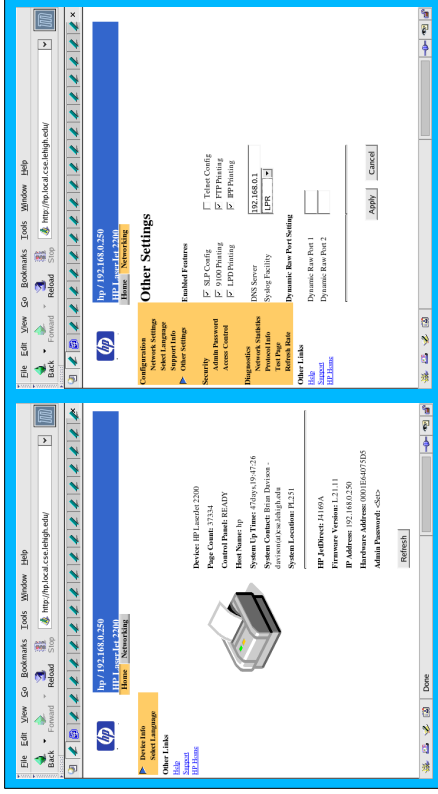

- Can be used to
 - Enable or disable queuing for a printer
 - Enable or disable printing on a printer
 - Remove all jobs from a printer queue
 - Move a job to the top of a printer's queue
 - Start, stop, or restart the `lpd` daemon
 - Get printer status information
- `lpadmin` much more powerful

Other common printing-related software

- ghostscript
 - Free PostScript interpreter to view PS files onscreen
 - Also used to drive raster devices (cheap printers) by rendering the PS in the format needed
 - Powers postscript-viewing front-ends
- encrypt (and the older mpage)
 - Re-formats text or PostScript to have multiple logical pages per physical page
 - Also has nice page headers, many options (installed on sunlab machines)

Adding a printer in CUPS

- From command line:
 - lpadmin -p fezmo -E -v socket://192.168.0.12 -m laserjet.ppd
 - lpadmin -p groucho -E -v parallel:/dev/lp0 -m pcolor.ppd
- From browser: <http://localhost:631/admin>
 - Even works on Macs!
- From Red Hat/CentOS
 - Command line: system-config-printer
 - GUI: System->Administration->Printing

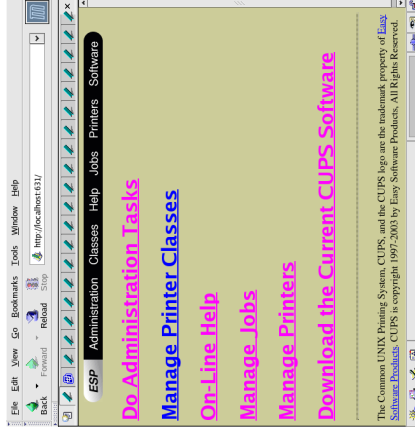

Spring 2016

Viewing print files

- Acrobat reader (acroread)
- evince
- display (ImageMagick)
- Ghostscript
 - Front-ends like gv, ggv, KghostView
